

## ADC0808/ADC0809 8-Bit $\mu$ P Compatible A/D Converters with 8-Channel Multiplexer

Check for Samples: [ADC0808-N](#), [ADC0809-N](#)

### FEATURES

- Easy Interface to All Microprocessors
- Operates Ratiometrically or with 5 V<sub>DC</sub> or Analog Span Adjusted Voltage Reference
- No Zero or Full-Scale Adjust Required
- 8-Channel Multiplexer with Address Logic
- 0V to V<sub>CC</sub> Input Range
- Outputs meet TTL Voltage Level Specifications
- ADC0808 Equivalent to MM74C949
- ADC0809 Equivalent to MM74C949-1

### KEY SPECIFICATIONS

- Resolution: 8 Bits
- Total Unadjusted Error:  $\pm\frac{1}{2}$  LSB and  $\pm 1$  LSB
- Single Supply: 5 VDC
- Low Power: 15 mW
- Conversion Time: 100  $\mu$ s

### DESCRIPTION

The ADC0808, ADC0809 data acquisition component is a monolithic CMOS device with an 8-bit analog-to-digital converter, 8-channel multiplexer and microprocessor compatible control logic. The 8-bit A/D converter uses successive approximation as the conversion technique. The converter features a high impedance chopper stabilized comparator, a 256R voltage divider with analog switch tree and a successive approximation register. The 8-channel multiplexer can directly access any of 8-single-ended analog signals.

The device eliminates the need for external zero and full-scale adjustments. Easy interfacing to microprocessors is provided by the latched and decoded multiplexer address inputs and latched TTL TRI-STATE outputs.

The design of the ADC0808, ADC0809 has been optimized by incorporating the most desirable aspects of several A/D conversion techniques. The ADC0808, ADC0809 offers high speed, high accuracy, minimal temperature dependence, excellent long-term accuracy and repeatability, and consumes minimal power. These features make this device ideally suited to applications from process and machine control to consumer and automotive applications. For 16-channel multiplexer with common output (sample/hold port) see ADC0816 data sheet. (See AN-247 (Literature Number [SNOA595](#)) for more information.)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings<sup>(1)(2)(3)</sup>

Supply Voltage ( $V_{CC}$ ) <sup>(4)</sup>		6.5V
Voltage at Any Pin Except Control Inputs		-0.3V to ( $V_{CC}+0.3V$ )
Voltage at Control Inputs (START, OE, CLOCK, ALE, ADD A, ADD B, ADD C)		-0.3V to +15V
Storage Temperature Range		-65°C to +150°C
Package Dissipation at $T_A=25^\circ\text{C}$		875 mW
Lead Temp. (Soldering, 10 seconds)	PDIP Package (plastic)	260°C
	PLCC Package	Vapor Phase (60 seconds)
		Infrared (15 seconds)
ESD Susceptibility <sup>(5)</sup>		400V

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating conditions.
- (2) All voltages are measured with respect to GND, unless otherwise specified.
- (3) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (4) A Zener diode exists, internally, from  $V_{CC}$  to GND and has a typical breakdown voltage of 7  $V_{DC}$ .
- (5) Human body model, 100 pF discharged through a 1.5 k $\Omega$  resistor.

### Operating Conditions<sup>(1)(2)</sup>

Temperature Range	$T_{MIN} \leq T_A \leq T_{MAX}$ -40°C $\leq T_A \leq$ +85°C
Range of $V_{CC}$	4.5 $V_{DC}$ to 6.0 $V_{DC}$

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating conditions.
- (2) All voltages are measured with respect to GND, unless otherwise specified.

### Electrical Characteristics – Converter Specifications

**Converter Specifications:**  $V_{CC}=5$   $V_{DC}=V_{REF+}$ ,  $V_{REF(-)}=GND$ ,  $T_{MIN} \leq T_A \leq T_{MAX}$  and  $f_{CLK}=640$  kHz unless otherwise stated.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
	ADC0808	25°C			$\pm\frac{1}{2}$	LSB
	Total Unadjusted Error <sup>(1)</sup>	$T_{MIN}$ to $T_{MAX}$			$\pm\frac{3}{4}$	LSB

- (1) Total unadjusted error includes offset, full-scale, linearity, and multiplexer errors. See Figure 5. None of these A/Ds requires a zero or full-scale adjust. However, if an all zero code is desired for an analog input other than 0.0V, or if a narrow full-scale span exists (for example: 0.5V to 4.5V full-scale) the reference voltages can be adjusted to achieve this. See Figure 15.

## Electrical Characteristics – Converter Specifications (continued)

**Converter Specifications:**  $V_{CC}=5$   $V_{DC}=V_{REF+}$ ,  $V_{REF(-)}=GND$ ,  $T_{MIN} \leq T_A \leq T_{MAX}$  and  $f_{CLK}=640$  kHz unless otherwise stated.

Symbol	Parameter	Conditions	Min	Typ	Max	Units
	ADC0809					
	Total Unadjusted Error <sup>(1)</sup>	0°C to 70°C			±1	LSB
		$T_{MIN}$ to $T_{MAX}$			±1¼	LSB
	Input Resistance	From Ref(+) to Ref(-)	1.0	2.5		kΩ
	Analog Input Voltage Range	See <sup>(2)</sup> V(+) or V(-)	GND – 0.1		$V_{CC} + 0.1$	$V_{DC}$
$V_{REF(+)}$	Voltage, Top of Ladder	Measured at Ref(+)		$V_{CC}$	$V_{CC} + 0.1$	V
$\frac{V_{REF(+)} + V_{REF(-)}}{2}$	Voltage, Center of Ladder		$(V_{CC}/2) - 0.1$	$V_{CC}/2$	$(V_{CC}/2) + 0.1$	V
$V_{REF(-)}$	Voltage, Bottom of Ladder	Measured at Ref(-)	-0.1	0		V
$I_{IN}$	Comparator Input Current	$f_c=640$ kHz, <sup>(3)</sup>	-2	±0.5	2	µA

- (2) Two on-chip diodes are tied to each analog input which will forward conduct for analog input voltages one diode drop below ground or one diode drop greater than the  $V_{CC}$  supply. The spec allows 100 mV forward bias of either diode. This means that as long as the analog  $V_{IN}$  does not exceed the supply voltage by more than 100 mV, the output code will be correct. To achieve an absolute 0V<sub>DC</sub> to 5V<sub>DC</sub> input voltage range will therefore require a minimum supply voltage of 4.900 V<sub>DC</sub> over temperature variations, initial tolerance and loading.
- (3) Comparator input current is a bias current into or out of the chopper stabilized comparator. The bias current varies directly with clock frequency and has little temperature dependence (Figure 8). See [ANALOG COMPARATOR INPUTS](#)

## Electrical Characteristics – Digital Levels and DC Specifications

**Digital Levels and DC Specifications:** ADC0808CCN, ADC0808CCV, ADC0809CCN and ADC0809CCV,  $4.75 \leq V_{CC} \leq 5.25$  V,  $-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$  unless otherwise noted

(1) The outputs of the data register are updated one clock cycle before the rising edge of EOC.

## Functional Description

### MULTIPLEXER

The device contains an 8-channel single-ended analog signal multiplexer. A particular input channel is selected by using the address decoder. [Table 1](#) shows the input states for the address lines to select any channel. The address is latched into the decoder on the low-to-high transition of the address latch enable signal.

**Table 1. Analog Channel Selection**

SELECTED ANALOG CHANNEL	ADDRESS LINE		
	C	B	A
IN0	L	L	L
IN1	L	L	H
IN2	L	H	L
IN3	L	H	H
IN4	H	L	L
IN5	H	L	H
IN6	H	H	L
IN7	H	H	H

### CONVERTER CHARACTERISTICS

#### The Converter

The heart of this single chip data acquisition system is its 8-bit analog-to-digital converter. The converter is designed to give fast, accurate, and repeatable conversions over a wide range of temperatures. The converter is partitioned into 3 major sections: the 256R ladder network, the successive approximation register, and the comparator. The converter's digital outputs are positive true.

The 256R ladder network approach ([Figure 3](#)) was chosen over the conventional R/2R ladder because of its inherent monotonicity, which ensures no missing digital codes. Monotonicity is particularly important in closed loop feedback control systems. A non-monotonic relationship can cause oscillations that will be catastrophic for the system. Additionally, the 256R network does not cause load variations on the reference voltage.

The bottom resistor and the top resistor of the ladder network in [Figure 3](#) are not the same value as the remainder of the network. The difference in these resistors causes the output characteristic to be symmetrical with the zero and full-scale points of the transfer curve. The first output transition occurs when the analog signal has reached  $+\frac{1}{2}$  LSB and succeeding output transitions occur every 1 LSB later up to full-scale.

The successive approximation register (SAR) performs 8 iterations to approximate the input voltage. For any SAR type converter, n-iterations are required for an n-bit converter. [Figure 4](#) shows a typical example of a 3-bit converter. In the ADC0808, ADC0809, the approximation technique is extended to 8 bits using the 256R network.

The A/D converter's successive approximation register (SAR) is reset on the positive edge of the start conversion start pulse. The conversion is begun on the falling edge of the start conversion pulse. A conversion in process will be interrupted by receipt of a new start conversion pulse. Continuous conversion may be accomplished by tying the end-of-conversion (EOC) output to the SC input. If used in this mode, an external start conversion pulse should be applied after power up. End-of-conversion will go low between 0 and 8 clock pulses after the rising edge of start conversion.

The most important section of the A/D converter is the comparator. It is this section which is responsible for the ultimate accuracy of the entire converter. It is also the comparator drift which has the greatest influence on the repeatability of the device. A chopper-stabilized comparator provides the most effective method of satisfying all the converter requirements.

The chopper-stabilized comparator converts the DC input signal into an AC signal. This signal is then fed through a high gain AC amplifier and has the DC level restored. This technique limits the drift component of the amplifier since the drift is a DC component which is not passed by the AC amplifier. This makes the entire A/D converter extremely insensitive to temperature, long term drift and input offset errors.

Figure 6 shows a typical error curve for the ADC0808.

## APPLICATIONS INFORMATION

### OPERATION

#### RATIOMETRIC CONVERSION

The ADC0808, ADC0809 is designed as a complete Data Acquisition System (DAS) for ratiometric conversion systems. In ratiometric systems, the physical variable being measured is expressed as a percentage of full-scale which is not necessarily related to an absolute standard. The voltage input to the ADC0808 is expressed by the equation

$$\frac{V_{IN}}{V_{fs} - V_Z} = \frac{D_X}{D_{MAX} - D_{MIN}}$$

- $V_{IN}$  = Input voltage into the ADC0808
- $V_{fs}$  = Full-scale voltage
- $V_Z$  = Zero voltage
- $D_X$  = Data point being measured
- $D_{MAX}$  = Maximum data limit
- $D_{MIN}$  = Minimum data limit

(1)

A good example of a ratiometric transducer is a potentiometer used as a position sensor. The position of the wiper is directly proportional to the output voltage which is a ratio of the full-scale voltage across it. Since the data is represented as a proportion of full-scale, reference requirements are greatly reduced, eliminating a large source of error and cost for many applications. A major advantage of the ADC0808, ADC0809 is that the input voltage range is equal to the supply range so the transducers can be connected directly across the supply and their outputs connected directly into the multiplexer inputs, (Figure 11).

Ratiometric transducers such as potentiometers, strain gauges, thermistor bridges, pressure transducers, etc., are suitable for measuring proportional relationships; however, many types of measurements must be referred to an absolute standard such as voltage or current. This means a system reference must be used which relates the full-scale voltage to the standard volt. For example, if  $V_{CC} = V_{REF} = 5.12V$ , then the full-scale range is divided into 256 standard steps. The smallest standard step is 1 LSB which is then 20 mV.

#### RESISTOR LADDER LIMITATIONS

The voltages from the resistor ladder are compared to the selected into 8 times in a conversion. These voltages are coupled to the comparator via an analog switch tree which is referenced to the supply. The voltages at the top, center and bottom of the ladder must be controlled to maintain proper operation.

The top of the ladder, Ref(+), should not be more positive than the supply, and the bottom of the ladder, Ref(-), should not be more negative than ground. The center of the ladder voltage must also be near the center of the supply because the analog switch tree changes from N-channel switches to P-channel switches. These limitations are automatically satisfied in ratiometric systems and can be easily met in ground referenced systems.

Figure 12 shows a ground referenced system with a separate supply and reference. In this system, the supply must be trimmed to match the reference voltage. For instance, if a 5.12V is used, the supply should be adjusted to the same voltage within 0.1V.

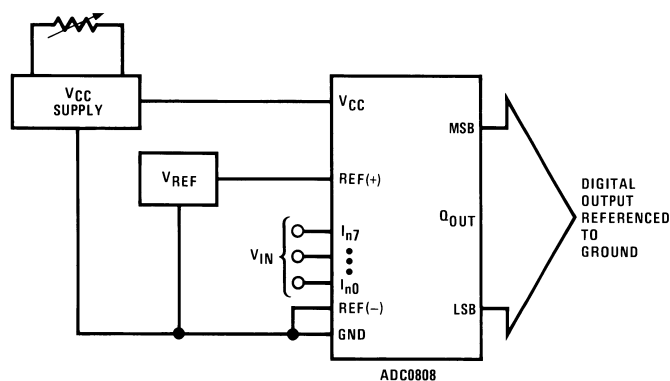

Figure 11. Ratiometric Conversion System

The ADC0808 needs less than a milliamp of supply current so developing the supply from the reference is readily accomplished. In Figure 13 a ground referenced system is shown which generates the supply from the reference. The buffer shown can be an op amp of sufficient drive to supply the milliamp of supply current and the desired bus drive, or if a capacitive bus is driven by the outputs a large capacitor will supply the transient supply current as seen in Figure 14. The LM301 is overcompensated to insure stability when loaded by the 10  $\mu$ F output capacitor.

The top and bottom ladder voltages cannot exceed  $V_{CC}$  and ground, respectively, but they can be symmetrically less than  $V_{CC}$  and greater than ground. The center of the ladder voltage should always be near the center of the supply. The sensitivity of the converter can be increased, (i.e., size of the LSB steps decreased) by using a symmetrical reference system. In Figure 15, a 2.5V reference is symmetrically centered about  $V_{CC}/2$  since the same current flows in identical resistors. This system with a 2.5V reference allows the LSB bit to be half the size of a 5V reference system.

$$Q_{OUT} = \frac{V_{IN}}{V_{REF}}$$

$$4.75V \leq V_{CC} = V_{REF} \leq 5.25V$$

Figure 12. Ground Referenced Conversion System Using Trimmed Supply

$$Q_{OUT} = \frac{V_{IN}}{V_{REF}}$$

$$4.75V \leq V_{CC} = V_{REF} \leq 5.25V$$

Figure 13. Ground Referenced Conversion System with Reference Generating  $V_{CC}$  Supply

Figure 14. Typical Reference and Supply Circuit

$$R_A = R_B$$

\*Ratiometric transducers

Figure 15. Symmetrically Centered Reference

## CONVERTER EQUATIONS

The transition between adjacent codes N and N+1 is given by:

$$V_{IN} = \left\{ (V_{REF(+)} - V_{REF(-)}) \left[ \frac{N}{256} + \frac{1}{512} \right] \pm V_{TUE} \right\} + V_{REF(-)} \quad (2)$$

The center of an output code N is given by:

$$V_{IN} \left\{ (V_{REF(+)} - V_{REF(-)}) \left[ \frac{N}{256} \right] \pm V_{TUE} \right\} + V_{REF(-)} \quad (3)$$

The output code N for an arbitrary input are the integers within the range:

$$N = \frac{V_{IN} - V_{REF(-)}}{V_{REF(+)} - V_{REF(-)}} \times 256 \pm \text{Absolute Accuracy}$$

Where:

- $V_{IN}$  = Voltage at comparator input
- $V_{REF(+)}$  = Voltage at Ref(+)
- $V_{REF(-)}$  = Voltage at Ref(-)
- $V_{TUE}$  = Total unadjusted error voltage (typically
- $V_{REF(+)} \div 512$

(4)

## ANALOG COMPARATOR INPUTS

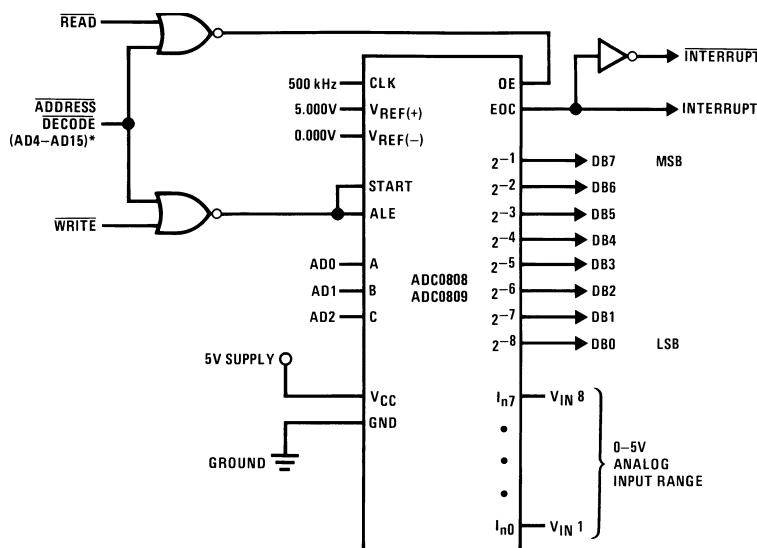

The dynamic comparator input current is caused by the periodic switching of on-chip stray capacitances. These are connected alternately to the output of the resistor ladder/switch tree network and to the comparator input as part of the operation of the chopper stabilized comparator.

The average value of the comparator input current varies directly with clock frequency and with  $V_{IN}$  as shown in Figure 8.

If no filter capacitors are used at the analog inputs and the signal source impedances are low, the comparator input current should not introduce converter errors, as the transient created by the capacitance discharge will die out before the comparator output is strobed.

If input filter capacitors are desired for noise reduction and signal conditioning they will tend to average out the dynamic comparator input current. It will then take on the characteristics of a DC bias current whose effect can be predicted conventionally.

## Typical Application

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale ([www.ti.com/legal/termsofsale.html](http://www.ti.com/legal/termsofsale.html)) or other applicable terms available either on [ti.com](http://ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.
